YOUSSEF NAIB · FULL-STACK DEVELOPER

I build complete web products, from server to screen.

Full-stack developer: Java APIs, React interfaces, data, deployment and security. My flagship project is a real online shop running in production, with its own admin back office, and a second store, Rawa Beauty, runs on the same code.

FLAGSHIP PROJECT · 01

TechZone Maroc

A complete electronics store, designed, built and shipped end to end: a fast storefront for customers, and an admin back office that runs everything, from orders to ad videos.

Live in production

techzone-maroc.com ↗

2 React apps: storefront and admin	**50+** database migrations
10 ad-video templates	**400+** commits since March 2026

STOREFRONT

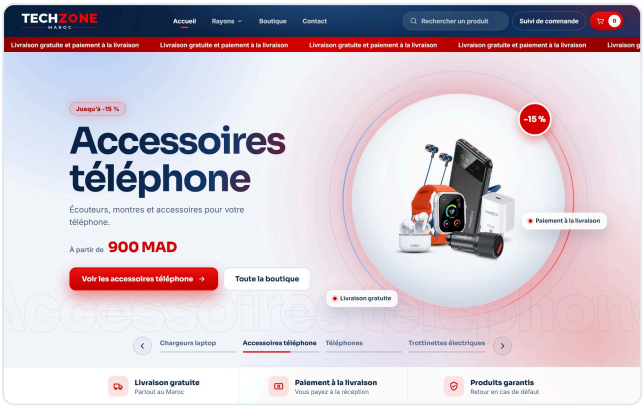

Shopping in a few taps, on phone and desktop alike.

React 19 · Vite · SEO · Playwright

01

A storefront that sells

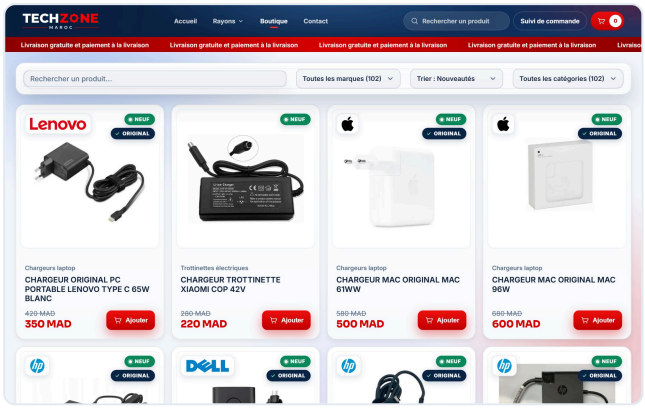

Category carousel, highlighted deals and clear promises: free delivery, cash on delivery, warranty.

02

Find the right product

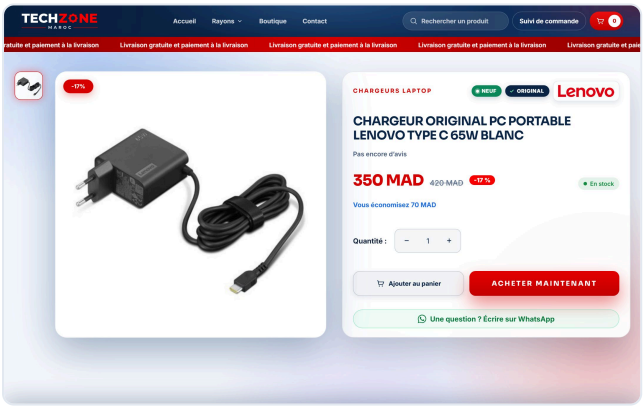

Catalogue by category, search, filters and sorting, with clear struck-through prices.

03

Guest checkout

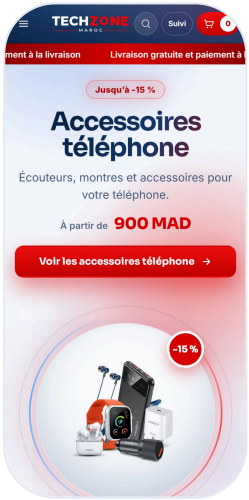

Detailed product page, customer reviews and a short order form, paid on delivery. WhatsApp / Facebook sharing and a Google Shopping feed.

04

Mobile first

Most customers shop on their phone: every screen is designed for the thumb and tested end to end with Playwright.

ADMIN BACK OFFICE

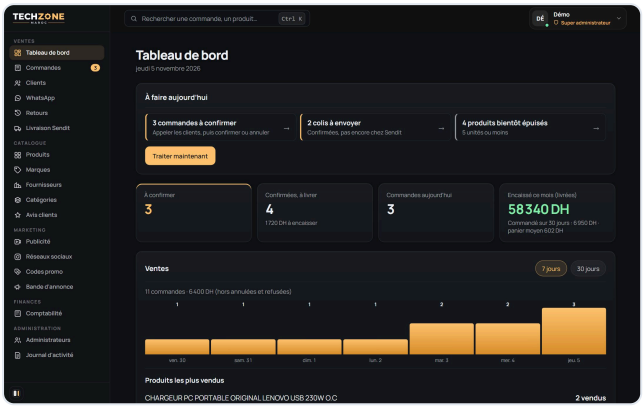

The whole business, run from a single tool.

React · Spring Security · JWT · Meta Graph API · TikTok API

01

The dashboard

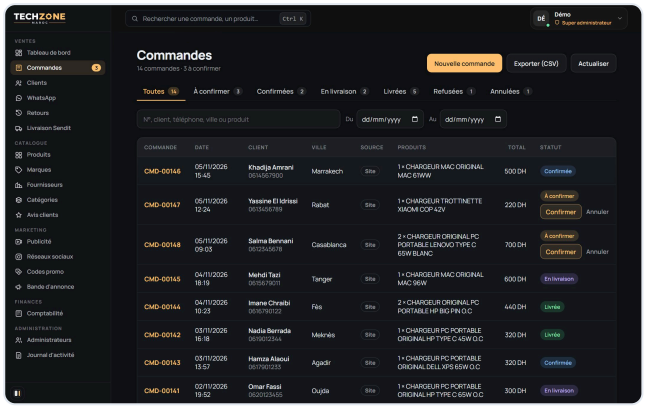

Revenue, orders to confirm, 7- or 30-day sales and low-stock alerts, as soon as you log in.

02

Orders

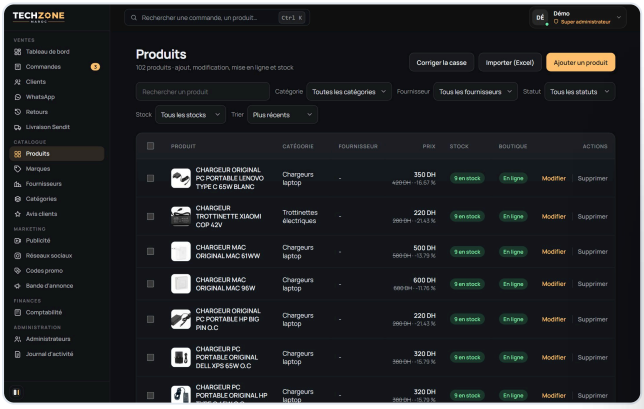

Status tracking from confirmation to delivery, search, date filters and CSV export.

03

The catalogue

Products, prices, promotions and stock, one-click publishing and Excel import. Roles, an activity log and two-factor authentication keep each admin in check.

04

The ad studio

Videos generated from a product: 10 templates, timeline editing, keyframes, captions, voice-over, loudness normalisation. Instagram / Facebook / TikTok publishing, image cut-out and enhancement. Shown here: a real video straight out of the rendering engine.

AND MORE

Twelve more modules, from customer to social network.

- Sendit
- Meta API
- TikTok API
- WhatsApp Cloud API
- Claude API
- Remotion

01

Customers and blacklist

One customer per phone number: orders, delivered, refused, refusal rate. Loyal / at-risk filters; "Flag" or "Block" from the blacklist, and the shop then refuses the order.

02

Returns and warranty

Refusals, returns, exchanges, warranty. A carrier refusal opens a return by itself; on receipt, good items go back to stock and defective ones are written off.

03

Sendit payouts

Cash due from delivered parcels, parcels unpaid for over 10 days, statement import (CSV or Excel, columns auto-detected) and detection of amount and fee gaps.

04

Delivery rates

Per-destination rates read live from Sendit, compared with the median, with alerts: missing or zero rate, far from the median, changed since a shipment, different billed fees.

05

Promo codes

Percentage with a cap or fixed amount, minimum basket, dates and usage limit. The discount is computed and applied by the server, never by the browser.

06

Instagram and Facebook promotion

Publishing and paid promotion from the admin, pixel and Conversions API, sales attributed through UTM, deletion synced with the networks and an alert when the promoted product changed.

07

TikTok

Pixel and server-side Events API (hashed phone, deduplicated events), OAuth connection and direct posting with the caption, from the same "Publish" dialog as Instagram and Facebook.

08

Timeline video editor

10 templates, keyframes, undo / redo, autosave, multiple music and voice-over tracks, imported clips, previews rendered by the real engine and a "Check" tab that flags problems before publishing.

09

AI WhatsApp assistant

WhatsApp Cloud API and Claude (Anthropic API) with tools wired to the real database: prices, stock, order tracking, photos, choice buttons, and order taking once the customer approves a recap. Hand-off to the team, abuse guards and live AI cost tracking.

10

Order confirmation

Call queue with the outcome of each call, confirmation by WhatsApp message, and confirmation and delivery rates by product, city and source.

11

Order tracking

Customers track their parcel from the shop, with no account, using their order number and phone; a direct WhatsApp button on every product page.

12

Suppliers and accounting

Every product linked to its supplier, income and expenses in the accounts, and a sales dashboard by city and category with campaign margins.

PROJECT · 02

Rawa Beauty

A beauty store for Libya, built on the same code as TechZone: Arabic by default with English one click away, Libyan dinar, Shipeh delivery, and its own light, immersive visual identity.

Live in production

rawabeauty.com ↗

1 codebase for both stores	**2** languages: Arabic (right to left) and English
0 visual changes to TechZone, checked automatically	**3** hero photo sizes, picked per screen

STOREFRONT

A storefront that makes you want to buy, in Arabic and English.

React 19 · RTL · i18n · CSS animations

01

A full-screen opening

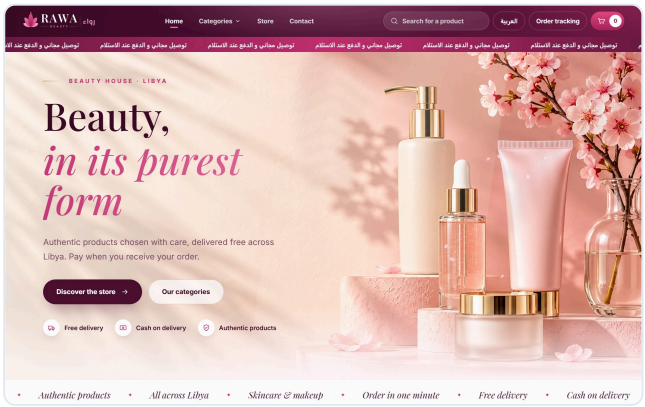

A full-width staged photo with a drifting palm shadow, a light beam and falling petals. Animations use only transform and opacity and pause off screen, so nothing feels slow.

02

Arabic first, English in one click

The whole page flips right to left, photo included. Categories show in Arabic while links and filters keep the same name in the database.

03

Categories at a glance

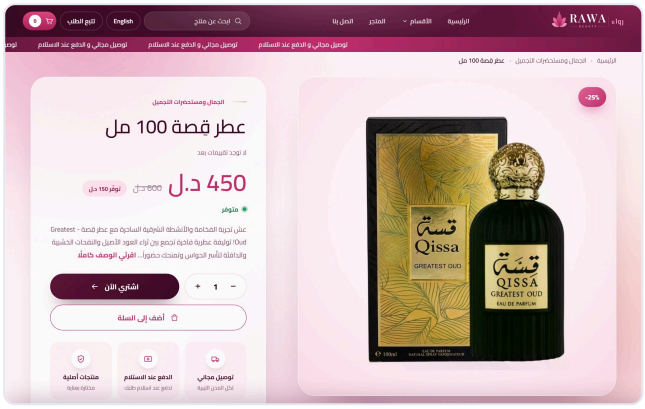

Five worlds on a single row as photo arches, then the latest products with direct add to cart.

04

A product page built like a landing page

Price, savings, stock and buy buttons up top, then a staged description: a headline, key points alternating with usage photos added from the admin, how-to steps and a buy bar that follows the scroll.

05

Designed for the phone

On phones, the text moves to the top and a dedicated portrait photo takes over, lighter to load.

ADMIN BACK OFFICE

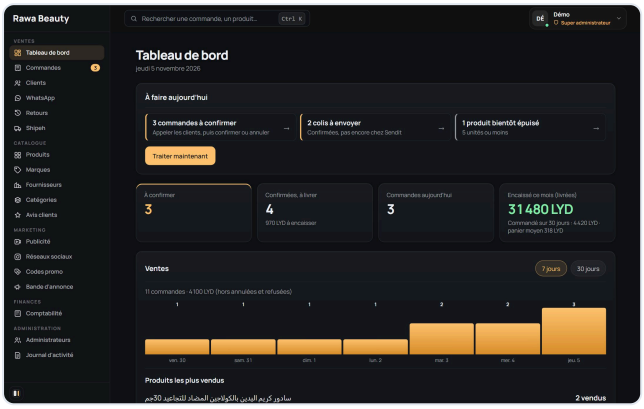

The same back office, set up for another country.

Multi-marque · LYD · Shipeh

01

One brand, one configuration

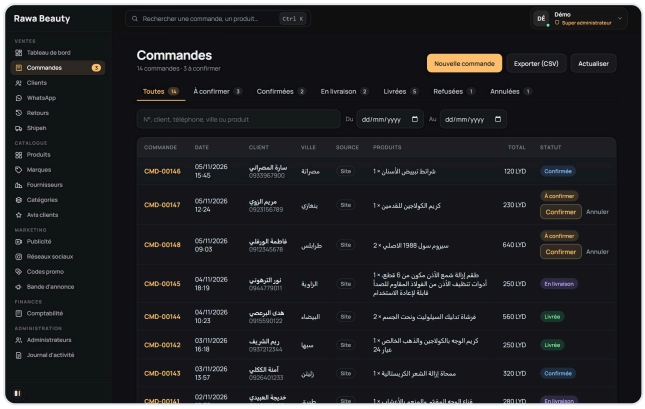

Name, currency, country and carrier come from the brand: the dashboard counts in Libyan dinars and the menu shows Shipeh instead of Sendit.

02

Orders in Arabic

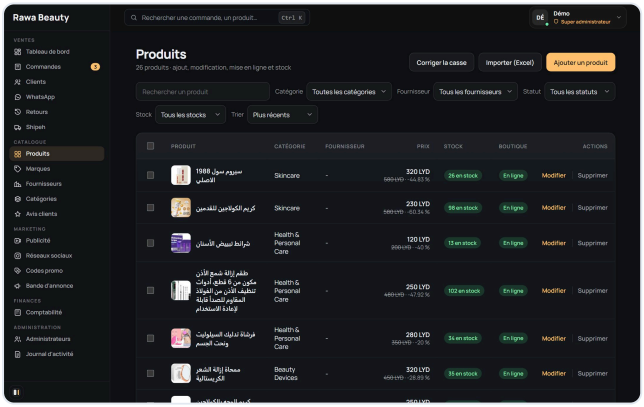

Arabic names, cities and products display in the right direction inside a French interface, with the same statuses and tracking as TechZone.

03

A separate catalogue

Each store has its own products, categories and usage photos on the same API and server, and deploys without rebuilding the other.

CHALLENGES AND SOLUTIONS

What production taught me.

A real site with real customers raises problems a school project never meets. Four examples.

01

Guest checkout without abuse

THE PROBLEM

With no account and no online payment, nothing stops floods of fake orders that lock stock and waste time on the phone.

THE SOLUTION

Duplicate detection, an order limit per phone number, the visitor's real IP behind the proxy, and stock released automatically when an order is cancelled or refused.

Spring Boot · Redis · Bucket4j

02

Securing an internet-facing admin

THE PROBLEM

The admin reaches orders, customers and social accounts: one stolen password would compromise everything.

THE SOLUTION

JWT authentication with refresh tokens, CSRF protection, two-factor authentication (TOTP) with a recovery path, login rate limiting and restricted roles.

Spring Security · JWT · TOTP

03

Rendering video on a small server

THE PROBLEM

Video rendering is very memory- and CPU-hungry: in production, the Premium template kept failing on the VPS.

THE SOLUTION

A separate Remotion rendering service with a job queue, rendering limited to the cores actually available, and FFmpeg loudness normalisation for Instagram and Facebook.

Remotion · Node.js · FFmpeg · Docker

04

Never losing data

THE PROBLEM

Evolving a live site's database without breaking existing orders, and being able to recover everything if the server dies.

THE SOLUTION

Versioned Flyway migrations with the schema validated at startup, daily backups copied off the server, a restore test and uptime monitoring.

PostgreSQL · Flyway · Hibernate

UNDER THE HOOD

A production architecture, not a demo.
